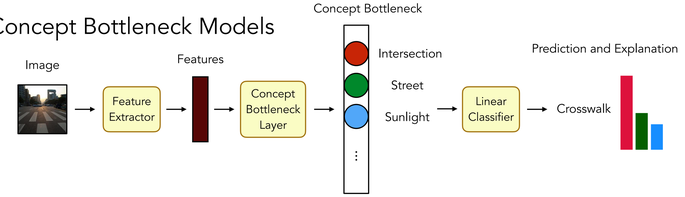
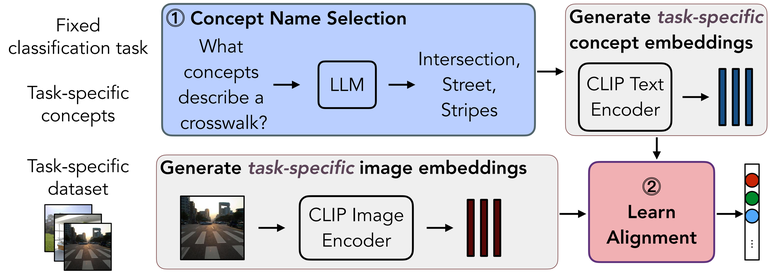
Background

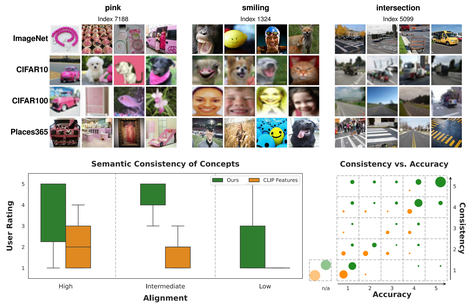
Concept Bottleneck Models



Typical approach: Select concept names, learn mapping

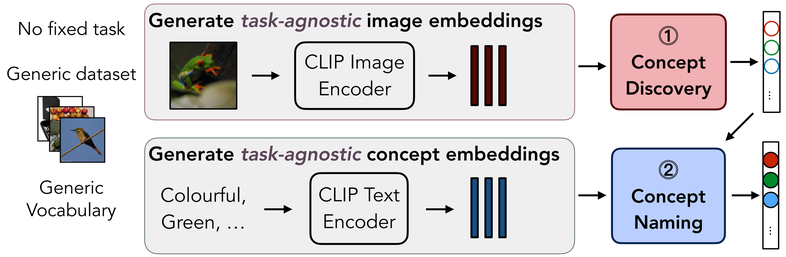


Consistent and interpretable concepts



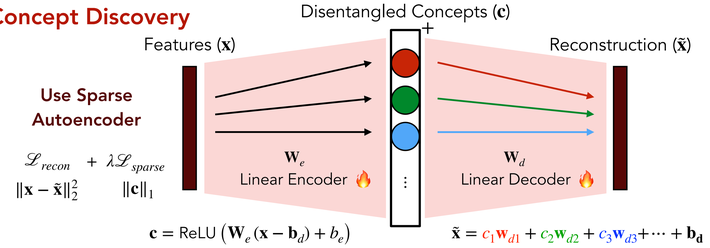
Granularity controllable by vocabulary

Ours: Discover concepts, then assign names



- Identifies concepts used by the model
- No LLM queries needed
- Single concept bottleneck for multiple datasets

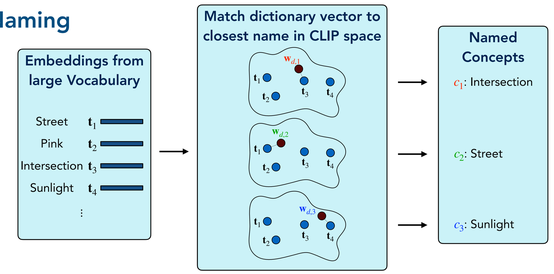
① Concept Discovery



$$\mathbf{c} = \mathrm{ReLU}\left(\mathbf{W}_e(\mathbf{x} - \mathbf{b}_d) + b_e\right)$$

$$\tilde{\mathbf{x}} = c_1\mathbf{w}_{d1} + c_2\mathbf{w}_{d2} + c_3\mathbf{w}_{d3} + \cdots + \mathbf{b}_d$$

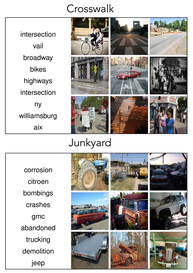
② Concept Naming



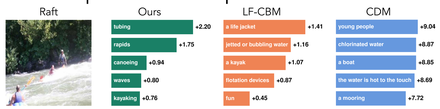
Concept Bottleneck Model: DN-CBM

Explanations for model decisions

Class-level explanations



Similar explanations to prior work



Competitive classification accuracy

Model	CLIP ResNet-50				CLIP ViT-B/16			
	Places365	ImageNet	CIFAR10	CIFAR100	Places365	ImageNet	CIFAR10	CIFAR100
Linear Probe	53.4	73.3	88.7	70.3	55.1	80.2	96.2	83.1
Zero Shot	38.7	59.6	75.6	41.6	41.2	68.6	91.6	68.7

Effective Interventions

Pruned Concepts	
Landbird: Bird	sparrow, parrot, crow
Landbird: Non-bird	forest, clic
Waterbird: Bird	gull, ducks
Waterbird: Non-bird	landing, beach,

Model	Overall	Worst Groups		Training Groups	
		Landbird on Water	Waterbird on Land	Landbird on Land	Waterbird on Water
Before Intervention	82.8	71.3	57.5	**98.6**	**93.3**
Only Bird Concepts	**89.4** (+6.6)	**86.6** (+15.3)	**71.3** (+13.8)	96.8 (-1.8)	91.4 (-1.9)
Only Non-bird Concepts	60.8 (-22.0)	28.5 (-42.8)	28.8 (-28.7)	95.0 (-3.6)	85.8 (-7.5)
